COMICCRAFT – AI COMIC STORY CREATOR USING GEMINI MODELS

1. Brainstorming & Ideation Phase

1.1 Introduction

ComicCraft is a Generative AI-based application developed to create comic stories using Google Gemini models. The main idea of the project is to simplify the comic creation process by using Artificial Intelligence for story generation, character development, dialogue creation, and comic panel generation.

1.2 Problem Identification

Creating a comic manually requires several activities such as developing a story, creating characters, writing dialogues, preparing scene descriptions, generating images, arranging comic panels, and exporting the final comic.

These activities can take considerable time and require different creative and technical skills. Beginners may also find it difficult to create a complete comic from an idea.

Therefore, there is a need for a simple AI-powered application that can convert a user's basic story idea into a complete comic.

1.3 Proposed Idea

The proposed project is named **ComicCraft – AI Comic Story Creator using Gemini Models**.

The application allows users to provide basic information such as:

- Story Prompt
- Character Name
- Setting
- Tone
- Art Style

Based on these inputs, Google Gemini models generate the story outline, narration, dialogues, and detailed prompts for the comic scenes.

The generated information is then used to create comic panels and images. The completed comic can be previewed and exported as a PDF.

1.4 Main Objectives

The main objectives of ComicCraft are:

1. To create an AI-powered comic story generation application.
2. To use Google Gemini models for generating creative stories.
3. To generate characters, narration, and dialogues automatically.
4. To create suitable prompts for comic scene images.
5. To generate multiple comic panels.
6. To provide a simple and user-friendly web interface.
7. To allow users to preview the generated comic.
8. To provide an option to export the final comic as a PDF.

1.5 Brainstorming Process

During the brainstorming stage, different ideas related to Generative AI applications were considered. The possibility of using AI for creative content generation was explored.

Comic generation was selected because it combines multiple Generative AI capabilities such as:

- Text generation
- Story development
- Character creation
- Dialogue generation
- Image generation
- Visual storytelling

The idea was then developed into a complete application concept called ComicCraft.

1.6 Expected Outcome

The expected outcome of the project is a web-based application where a user can enter a simple story idea and receive an AI-generated comic.

The system should transform the user's idea into a structured story containing multiple scenes, narration, dialogues, and images.

1.7 Conclusion

The Brainstorming and Ideation Phase helped identify the problem of time-consuming manual comic creation and provided an AI-based solution.

ComicCraft combines Google Gemini models with web technologies and image generation to create a simple and automated comic creation platform.
